V1 DRAFT · INTERNAL

Zero-chase group booking.

Group demand already lives on Roamly. It is hacked across accounts and off-platform payments, so high-value bookings drop at checkout. Groups turns that workaround into a product and every booking into an invite loop.

THE PROBLEM

Users sync availability across separate accounts and split payments off-platform. Result: checkout drop-off, lost booking fees, support strain.

THE TARGET

Stressed Trip Captains: bachelor/bachelorette and friend-group organizers. Test team offsite coordinators in parallel as the repeat-use segment.

THE PITCH

Book the experience, split the bill at checkout, never chase friends for money. Guests pay in one tap, no account needed.

THE MOTION: PRODUCT-LED, INVITEE LOOP AS THE ENGINE

1
Coordinator books
Places a 48-hour card hold to lock inventory.

2
Invitees pay
1-click guest checkout via Apple Pay or Google Pay, with SMS nudges.

3
Invitees activate
Post-payment: shared itinerary, offline pass, $25 credit on next trip.

4
New coordinators
Activated invitees plan the next group trip. Loop repeats.

CHANNELS, IN PRIORITY ORDER

1. **Convert existing demand.** Target multi-ticket carts, large-group searches and known workaround users with a "Make this a group booking" prompt in cart, email and push.
2. **Invitee loop.** The share link and SMS nudges are the main acquisition surface. Optimize guest checkout, the activation screen and credit size.
3. **Intent capture.** SEO for "[city] bachelorette activities" and group-trip queries, plus wedding and bachelorette creator partnerships.
4. **Minimal paid.** Retarget group-intent searchers only. Organic supplements acquisition, it does not replace it.

NORTH STAR METRIC

Activated new users per completed group booking

Guest payers who finish post-payment onboarding within 7 days, divided by completed group bookings. It tests the viral thesis directly. Targets set once cart and support baselines are in.

GUARDRAILS

Group checkout completion
All seats paid before hold

Coordinator fallback rate
Groups where the

90-day rebooking
Activated invitees who book

Group GBV and tickets
Gross booking value and

expires	coordinator absorbs unpaid seats	again; proves the $25 credit pays back	support tickets per group booking

OPEN QUESTIONS FOR V2

Unpaid seats. What happens at hold expiry, and who carries the risk?

Segment proof. Which segment shows the highest workaround volume in telemetry?

Credit ROI. What activation rate justifies the $25 credit?
